Irrigation Frequency  
Losses From Drought  
Conditions

## Compatibility

**Species:** All plants that associate with endo- and ectomycorrhizal fungi.

**Fungicides:** Non-systemic fungicides normally have no effect. Foliar applied fungicides normally have no effect. Systemic fungicides may be applied 2 weeks before or after use of product. Fungicide use according to label instructions do not extinguish mycorrhiza, they only inhibit development temporarily.

## Directions For Use

Mix with 100 gallons of water. Decant, if necessary.

### Established Trees:

- 1. Root Injection:** Inject in a 2 1/2 to 3 foot grid pattern from the trunk out to the drip line and beyond if possible. Apply 1-2 quarts of solution per injection site. Use up solution by the end of the day.
- 2. Drip Tape and Microjet:** Decant product before adding to mix tank. Apply at the rate of one pound per acre every six months supplemented every 3 months with BioRush® at two pounds per acre. Irrigate after application.

**New Tree Plantings:** Mix with water and use as a mud-in drench when planting new trees. One pound treats 175 one-year trees. Mix with water used to transplant accordingly.  
**Small and newly planted trees and shrubs:** Inject along the original root ball in 2-3 places using minimum 1/2 gallon for recently planted trees.

# DIEHARD™ Injectable

ALLIANCE  
HORTICULTURAL

**Nursery Propagation Drench:** Each 8 oz. bag treats 5,000 seedlings. Best application method is a 2-step process. Apply 1-2 weeks after sowing just as roots have developed to the sides of cells. Mix with sufficient water to apply as a drench with a backpack sprayer. Care should be taken to ensure that spores applied are drenched into the media to the level of the roots. Second application just as you are hardening off the crop for shipment.

**Landscape Installation Drench:** Just prior to installation of container plants mix 1 tablespoon product with 2 gallons of water for each 100 square feet of trailer/truck bed holding 40-50 plants.
